Different kind of errors

- Constant systematic errors, due to
 - increased blank values
 - incomplete recovery
- Proportional systematic errors, due to
 - wrong calibration
 - dilution errors
 - wrong calculation / wrong unit
- Gross and indefinable errors, due to
 - anything

How to identify the kind of error?

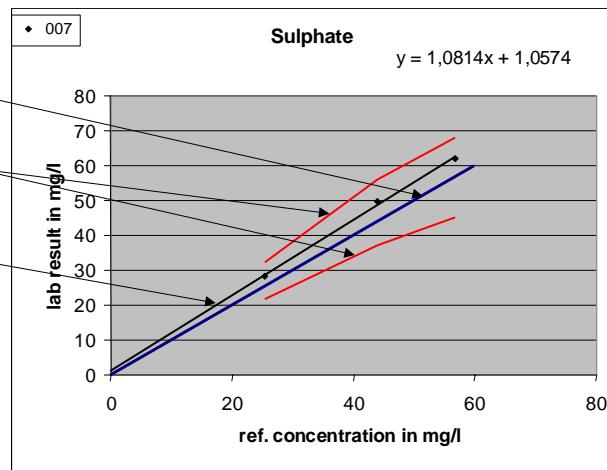

- Graphical display of analytical result vs. assigned value

100 % recovery

tolerance limits

linear regression line

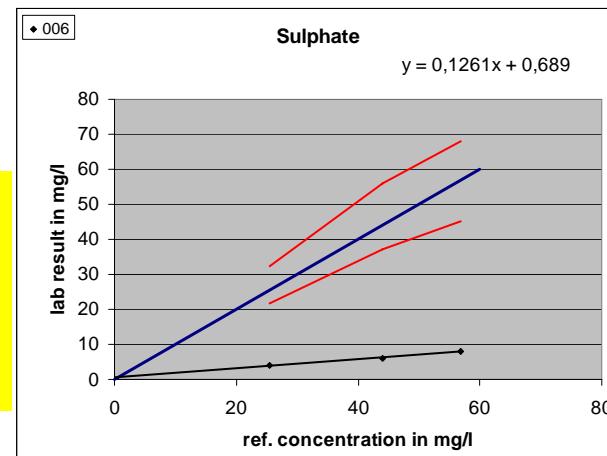

good analysis!
No serious error

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

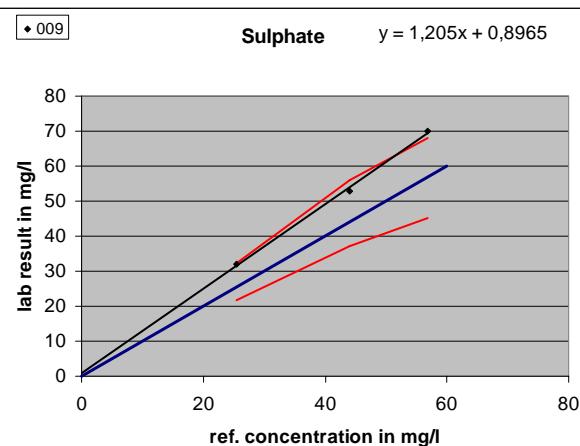

proportional
systematic error!
Dilution error,
calibration error
or gross
calibration error

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

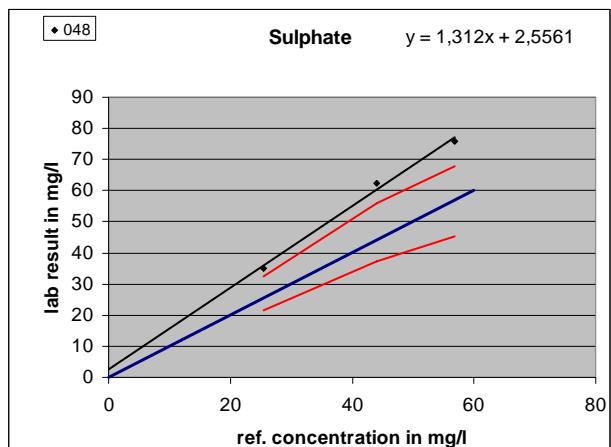

proportional
systematic error!
calibration error,
leading to results
just at the limit

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

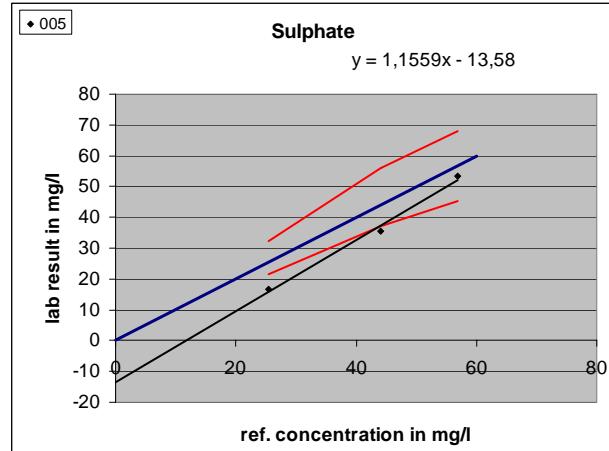

proportional
systematic error!
calibration error,
leading to results
beyond the limit

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

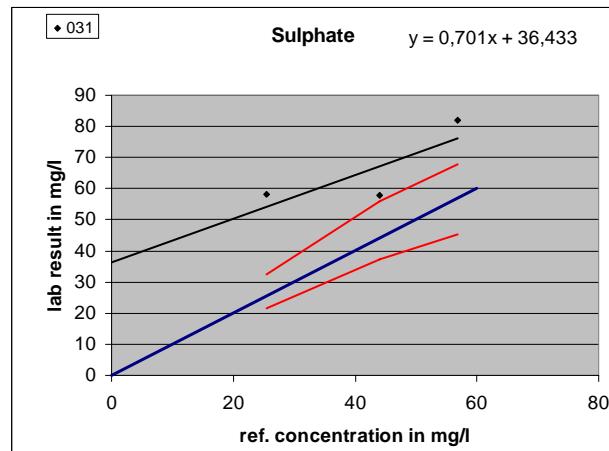

constant
systematic error?
recovery too low?

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

indefinable, gross
error

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone

What corrective actions to apply?

- If you found a proportional systematic error:
 - Check calibration
- Check for precision using internal quality control data (Control Charts)
- Check for bias using a certified or in-house reference material
- If you can't find the problem, carry out full method validation

Koch, M.: Classification of errors – SADCMET PT Workshop 2006 Gaborone
